Rethinking Arrays in R

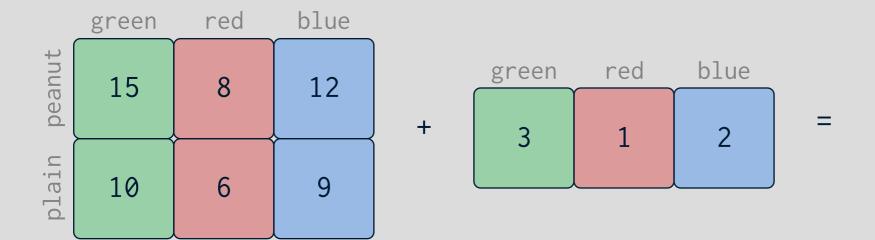

July 2019

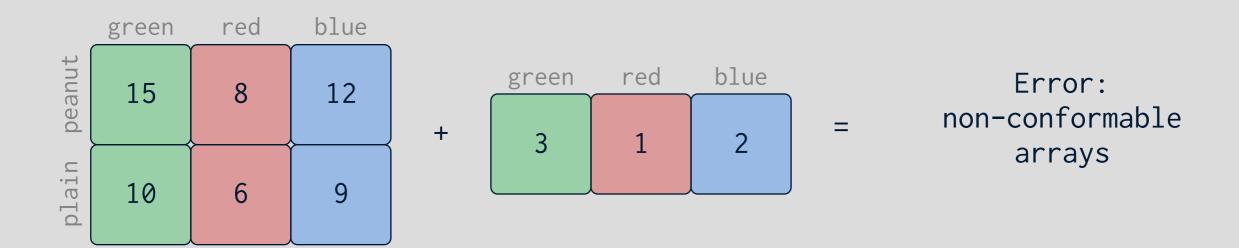

Davis Vaughan @dvaughan32 Software Engineer, RStudio

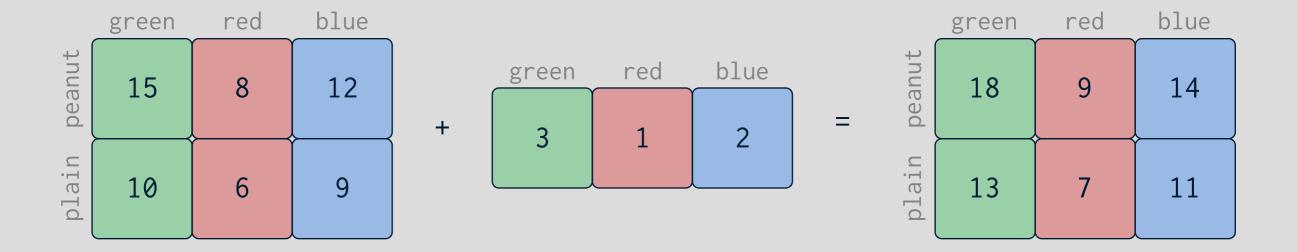

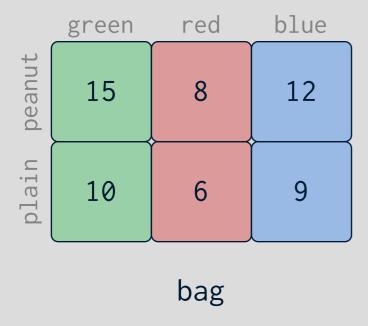

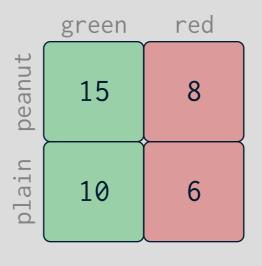

Subsetting

Broadcasting

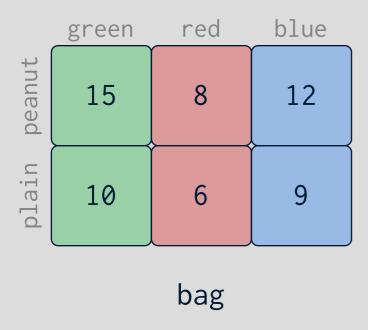

Manipulation

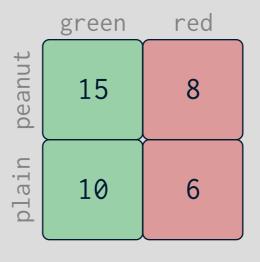

Subsetting

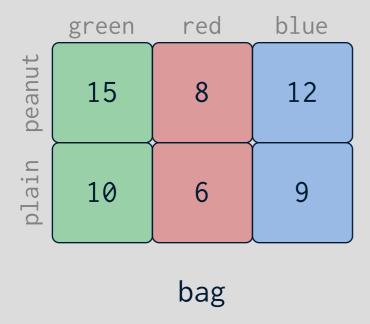

bag[,1:2]

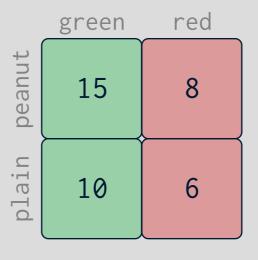

bag[,1:2]

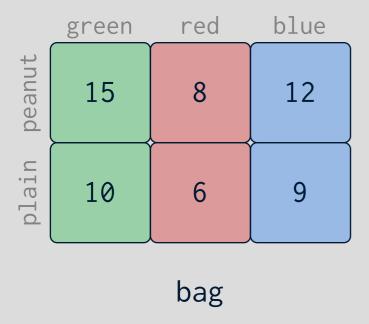

?

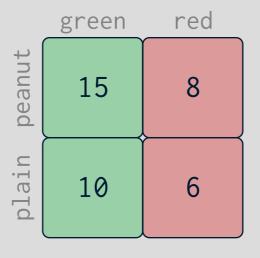

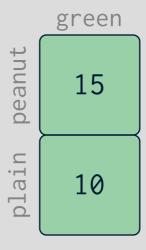

bag[,1:2]

peanut plain
[15 10]

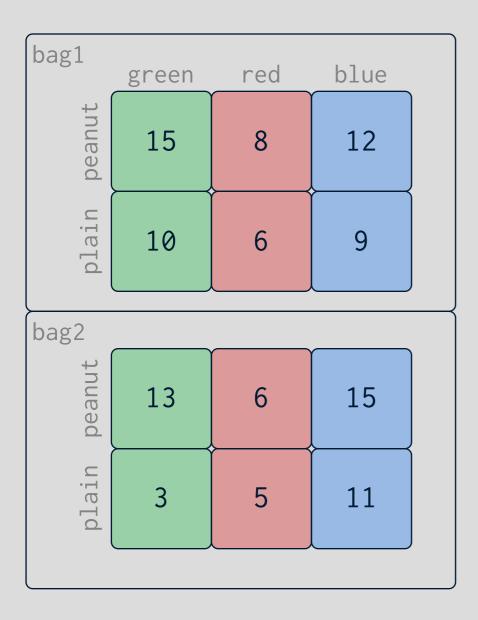

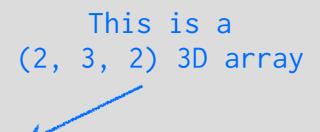

bag[,1:2]

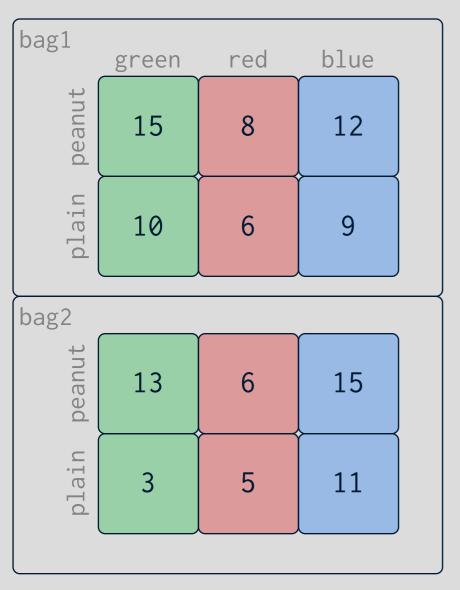

bag[, 1, drop = FALSE]

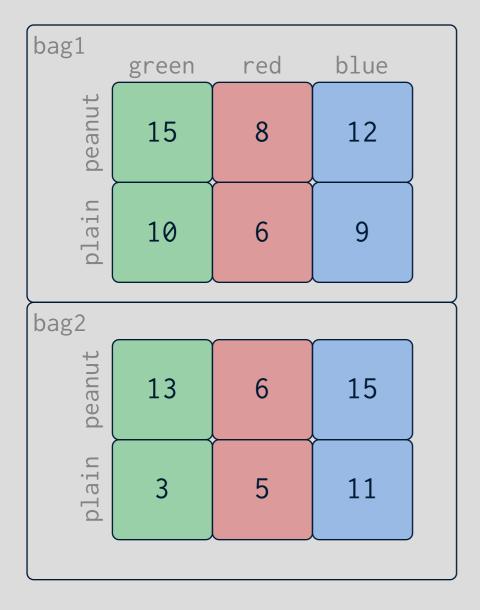

bags

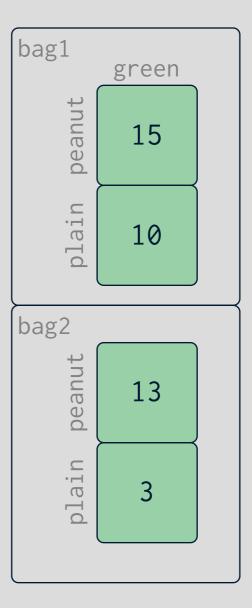

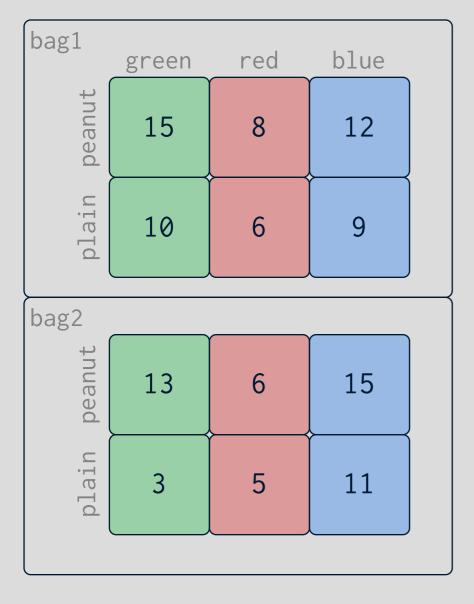

bags

bags

bags[, 1, , drop = FALSE]

bags

bags[, 1, drop = FALSE]
bag[, 1, drop = FALSE]

The confusion?

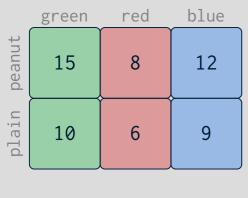

Subsetting is not dimensionality-stable.

rray

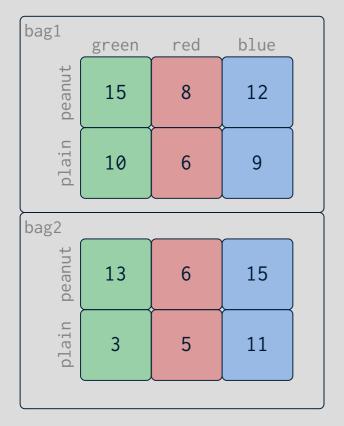

rray is designed to provide a stricter array class.

Create an rray

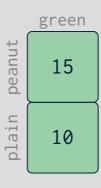

```
library(rray)
bag
#> green red blue
#> peanut 15 8 12
#> plain 10 6 9
bag_rray <- as_rray(bag)</pre>
bag_rray
#> <rray<dbl>[,3][2]>
#> green red blue
#> peanut 15 8 12
#> plain 10 6 9
```

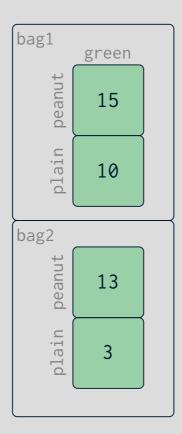

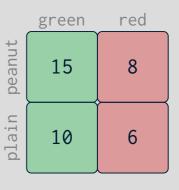

bags_rray

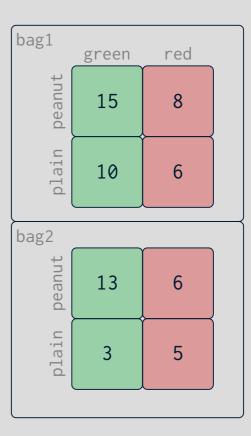

bag_rray[, 1]

bags_rray[, 1]

bag_rray[, 1:2]

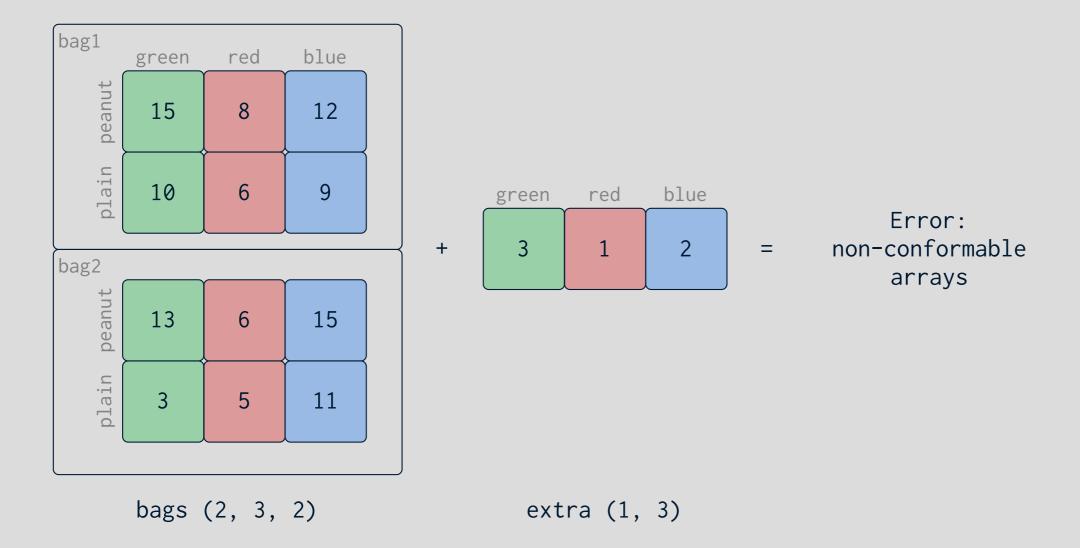

bags_rray[, 1:2]

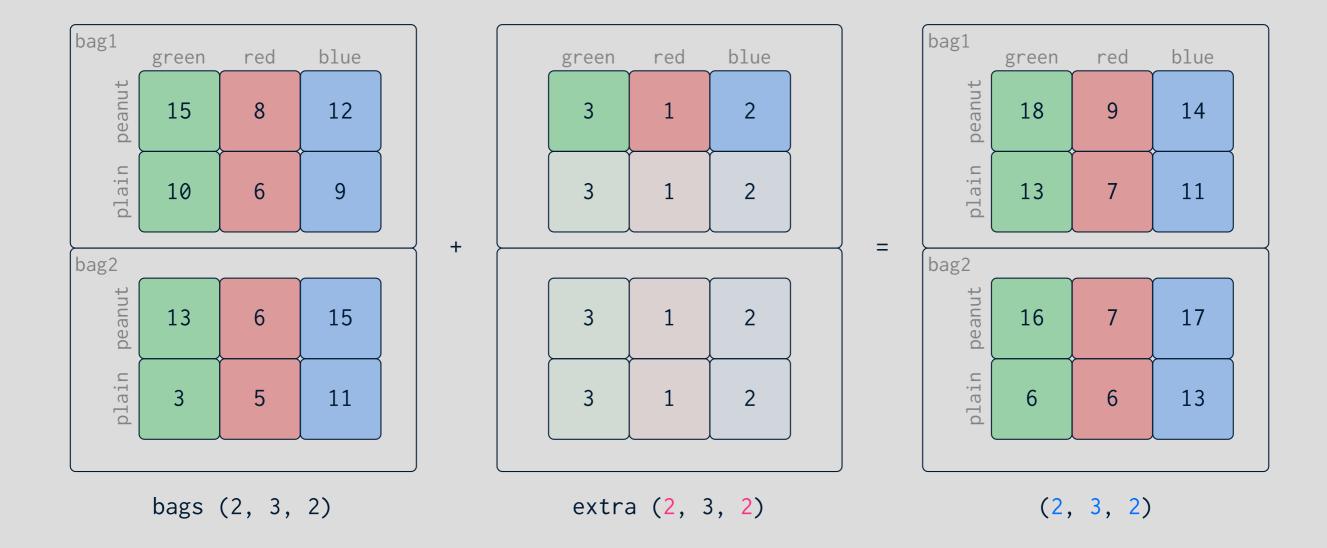

Broadcasting

Broadcasting has to do with

1) increasing dimensionality

2) recycling dimensions

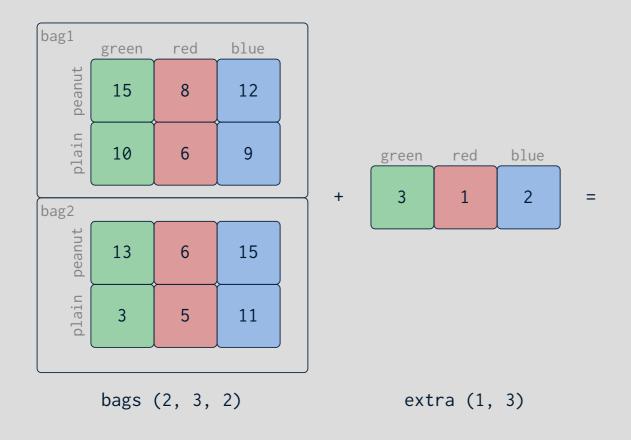

How is extra reshaped so that this works?

	# row	# col	# frame
bags	2	3	2
extra	1	3	
	?	?	?

	# row	# col	# frame
bags	2	3	2
extra	1	3	
	?	?	?

	# row	# col	# frame
bags	2	3	2
extra	1	3	1
	?	?	?

Т

	# row	# col	# frame
bags	2	3	2
extra	1	3	1
	?	?	?

	# row	# col	# frame
bags	2	3	2
extra	1 2	3	1
	? 2	?	?

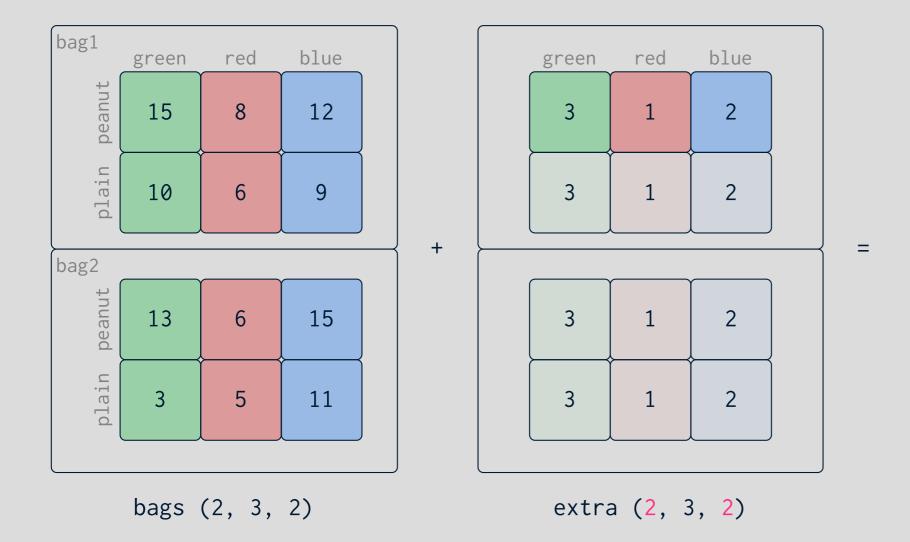

п

	# row	# col	# frame
bags	2	3	2
extra	1 2	3	1
	? 2	?	?

	# row	# col	# frame
bags	2	3	2
extra	1 2	3	1
	? 2	? 3	?

	# row	# col	# frame
bags	2	3	2
extra	1 2	3	1 2
	? 2	? 3	? 2

Broadcasting rules:

Match dimensionality by appending 1's

Match dimensions by recycling them

rray broadcasts

```
bag
#> green red blue
#> peanut 15 8 12
#> plain 10 6 9
extra
#> green red blue
#> [1,] 3 1 2
bag + extra
#> Error in bag + extra: non-conformable arrays
bag_rray + extra
#> <rray<dbl>[,3][2]>
#> green red blue
#> peanut 18 9 14
#> plain 13 7 11
```

Manipulation

rray as a toolkit

```
rray_bind()
                                          rray_mean()
rray_duplicate_any()
                                          rray_reshape()
rray_expand_dims()
                                         rray_rotate()
rray_broadcast()
                                          rray_split()
rray_flip()
                                          rray_tile()
rray_max()
                                          rray_unique()
rray_sum()
```

The best part?

The best part?

They all work with base R.

rray as a toolkit

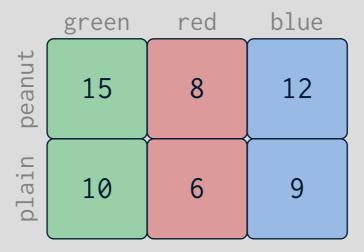

```
rray_bind()
                                          rray_mean()
rray_duplicate_any()
                                          rray_reshape()
rray_expand_dims()
                                         rray_rotate()
rray_broadcast()
                                          rray_split()
rray_flip()
                                          rray_tile()
rray_max()
                                          rray_unique()
rray_sum()
```

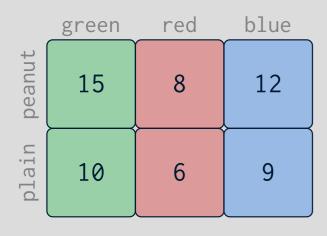

rray as a toolkit

```
rray_bind()
                                          rray_mean()
rray_duplicate_any()
                                          rray_reshape()
rray_expand_dims()
                                         rray_rotate()
rray_broadcast()
                                          rray_split()
rray_flip()
                                          rray_tile()
rray_max()
                                          rray_unique()
rray_sum()
```

Compute proportions

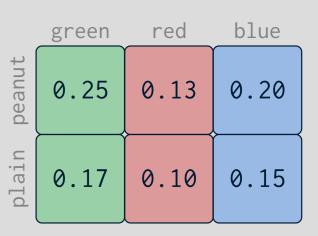

- 1) Overall
- 2) By filling
- 3) By color

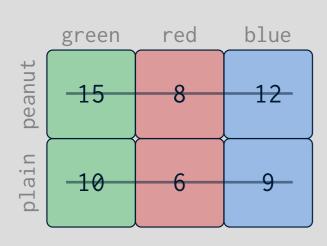

Overall

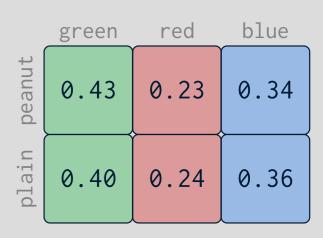

bag / sum(bag)

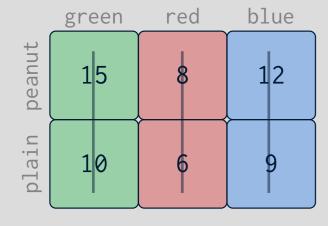

By Filling

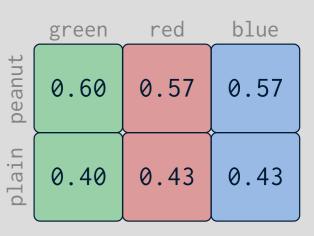

sweep(bag, 1, apply(bag, 1, sum), "/")

By Color

sweep(bag, 2, apply(bag, 2, sum), "/")

	green	red	blue
peanut	15	8	12
plain	10	6	9

Overall

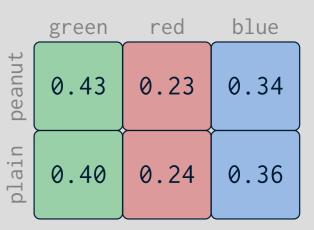

bag / rray_sum(bag)

	green	red	blue
peanut	0.25	0.13	0.20
plain	0.17	0.10	0.15

By Filling

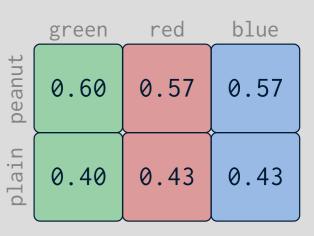

bag / rray_sum(bag, axes = 2)

By Color

bag / rray_sum(bag, axes = 1)

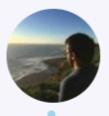

In conclusion...

1) Stricter rray class

- 2) Broadcasting
- 3) Toolkit

Questions?

Kanishka Misra 🧝 📈 📊 @iamasharkskin · Jun 19

Implemented a basic feedforward neural network in R using @dvaughan32's rray and the R6 OOP system. Will start working on a blog post (or two) soon.
